

ABSTRACT OF INVENTION

The invention has a hook on one end of the enclosure to hook to an eyelet of a fishing pole and could have a bendable tongue to close the open hook end. The hook is part of the container which encloses the lure and has an opening for the fishing line on the opposite side of the container leading back to the reel. The container is hinged to open and close or could be in two parts that snap together. The enclosing "box" could be cylindrical, square, or round. The idea is to enclose fishing lures or single hooks which come in many sizes and shapes while leaving them on the fishing pole.
